REACTOR DE CRISTALIZACIÓN (ID 258)

- La planta piloto para la producción de estruvita está compuesta por un reactor de 50 L de vidrio de borosilicato con forma cilíndrica.
- Se utilizó cloruro de magnesio ($MgCl_2 \cdot 6H_2O$) como fuente de magnesio.
- El pH de las muestras era de 8,5, por lo que fue necesario añadir un alcali concentrado (solución de NaOH al 50%) para elevar el valor del pH a 9,0.
